

NSV Stores Management System

A practical, click-by-click user guide

For Site Store Managers and Central Store Managers

Prepared by: Leroy H. Mapunzwana \ 2026-08-27

What this guide does. It explains what to click, what to enter, what the screen should show, and what a successful save looks like. It is written for users who operate the system, not for people who install or administer it.

Contents

1 Start here: the simple picture	1
2 Sign in and recognise your screen	1
3 The complete material-request journey	3
4 Site Store Manager: request materials	5
4.1 Open the request form	5

11 Central Store Manager: reports and daily checks	23
12 When the screen does not look right	24
13 One-page quick reference	25
14 Scope and training package	25

This guide deliberately excludes system-administrator procedures such as user provisioning, role assignment, database maintenance, environment configuration, Docker operations, and system reset.

1 Start here: the simple picture

The Stores Management System keeps a clear record of materials from the moment a site asks for stock, through central approval and dispatch, to site receipt and on-site use. The system is easiest to understand as a hand-off between two working roles. The **Site Store Manager** asks for stock, confirms what arrived, records consumption, and reports differences. The **Central Store Manager** maintains the item catalogue, records incoming supplier deliveries, approves requests, dispatches materials, and provides the dispatch note.

图 1 Role map: the two manager roles and the normal movement of stock.

The words used in this guide have one consistent meaning.

Term	Plain-language meaning	What you should expect to see
Available	Stock that can be used or requested now.	The number may fall when material is reserved or consumed.
Reserved	Stock held for an approved request but not yet dispatched.	A request can reduce Available while increasing Reserved.
Incoming	Stock expected from a supplier or another movement.	Incoming stock is not yet available for use.
GRN	Goods Received Note: the record created when a delivery is physically checked in.	A receipt changes to GRN Confirmed or Completed.
MIV	Material Issue Voucher: the issue record created when approved material is dispatched.	The dispatch row offers an MIV PDF after dispatch.
Discrepancy	A recorded difference between expected, dispatched, or received quantity.	The system can freeze the difference and show it under Discrepancies.

2 Sign in and recognise your screen

Open the local application in a browser and use the Email and Password fields. Then select **Sign In**. The system takes you to a dashboard that is tailored to your role. Do not be concerned if your screen has

fewer menu items than another colleague's screen: that is expected and prevents a site user from changing central-store data.

图 2 Login screen: enter your email and password, then select Sign In.

Role	Main work areas	Typical quick actions
Site Store Manager	Items, Issues & Dispatch, Returns, Material Requests, Consumption, Stock Counts, Projects, Employees, Change Password.	New Material Request; Return Items; Start Stock Count; Log Consumption.
Central Store Manager	Items, Expected Receipts, Issues & Dispatch, Returns, Discrepancies, Material Requests, Stock Counts, Projects, Stores, Employees, Reports, and Change Password.	Add New Item; New Expected Receipt; Review Requests; Issues & Dispatch; View Discrepancies; Reports.

图 3 Dashboard example: read Available Stock, Reserved Stock, alerts, pending work, and active projects before starting an action.

A good habit. Before you start a transaction, check the operating store shown near the top of the page. If the page says the wrong store or role, stop and sign out rather than saving a transaction against the wrong location.

3 The complete material-request journey

The request journey is a chain. A site request is not complete when it is typed; it is complete only after the central manager approves and dispatches it, and the site manager confirms the physical quantity received. The following diagram is the shortest explanation of the full hand-off.

图 4 Request lifecycle: follow the arrows from site request to central dispatch and site receipt. The rest of this guide explains each part of that chain in the same order as the buttons appear on screen.

4 Site Store Manager: request materials

4.1 Open the request form

From the site-manager dashboard, select **New Material Request**. You can also select **Material Requests** in the left navigation and then select **New Request**. The form opens with the site and project context at the top.

Operating as: Site Store (Demo Site Store) site.manager (SITE STORE MANAGER) Logout

Automatic checks

- Stock availability

图 5 Figure: Create Material Request form before a line is added.

4.2 Choose the project, source store, item, and quantity

Select the project that will use the material. Next select the source store, normally the central store. Select the item and type the quantity requested. The live stock panel is your safety check: it shows Available, On Hand, Reserved, Frozen, and Incoming quantities. Request no more than the Available quantity.

Field	What to do	What a safe entry looks like
-------	------------	------------------------------

Project	Choose the active project that will receive the work.	Harare Warehouse Refurbishment (DEMO-HARARE-001).
Source Store	Choose where the central stock will come from.	Demo Central Warehouse.
Item	Choose the catalogue item.	Demo Cement 25kg.
Quantity Requested	Enter the amount needed at the site.	10 BAG when Available is 30 BAG.

When the quantity is acceptable, the validation panel says **Request is valid** and shows **PASS**. If it says **Request exceeds available stock**, reduce the quantity or choose another item. Do not continue while the validation is blocked.

Select **Add to Request List**. The selected line appears under **Items in Request** with status **Draft**. The quantity-entry field resets to zero; this is normal. It does not remove the line you just added.

Operating as: Site Store (Demo Site Store) site.manager (SITE STORE MANAGER) Logout

Items in Request (1)

Item	Quantity	UOM	Status
Demo Cement 25kg	10	BAG	Draft Remove
Total (1 line)	10 BAG		

图 6 Figure: after Add to Request List, the line appears as Draft and the request can be submitted.

4.3 Submit and check the saved result

Review the project, source store, item, and quantity in the request list. Select **Submit Request**. The system returns to **Material Requests**. The new row shows a request number, the project, the requesting site store, the asking manager, and the status **Pending Approval**.

The screenshot displays the 'Material Requests' section of the NSV Stores Management System. The user is logged in as 'site.manager (SITE STORE MANAGER)' and is operating as 'Site Store (Demo Site Store)'. The interface shows a table of material requests with the following data:

Req No	Project Title & Code	Requesting Site Store	Items Requested	Asking Manager	Status	Action
4B478FA8	Harare Warehouse Refurbishment DEMO-HARARE-001	Demo Site Store	View Items (1)	Site Demo Manager	Pending Approval	—

The left sidebar contains navigation links for Overview, Warehouse, Operations, Projects, Administration, and Account. The 'Material Requests' link is highlighted with a red notification badge.

图 7 Figure: saved result: the request is listed as Pending Approval.

Status after saving	Meaning	Your next step
Pending Approval	The request is waiting for the source-store manager.	Wait for approval; do not create a duplicate request.
Approved	The central manager accepted a quantity.	The central manager can process dispatch.
In Transit	The material has been dispatched.	Inspect delivery and select Receive Items.
Received	The site confirmed physical receipt and the stock was deposited.	Use Consumption when material is used.

5 Central Store Manager: add an item

The central catalogue is the source of truth for item names, codes, categories, units, and reorder points. From the central dashboard, select **Add New Item**, or open **Items** and select **Add Item**.

图 8 Figure: Items page: select Add Item to create a catalogue item.

Complete the form from top to bottom. Enter an Item Name and a unique Item Code. The code is converted to uppercase when saved. Add an optional description, select a Category, select the Unit of Measure, enter the Reorder Point, enter Initial Stock Quantity if opening stock is physically present, and select the Target Store for Initial Stock.

Item saved successfully! Cancel Save Item

图 10 Figure: post-save result: the new item appears in the master catalogue with its stock status.

If Save Item does not work. Check that the Item Code is not already used, that the required fields are not blank, and that the selected quantity is not negative. A duplicate code is a data problem, not a reason to create a second spelling of the same item.

6 Central Store Manager: record an incoming order and receive it

An expected receipt is the system's "we are expecting this supplier delivery" record. It is useful for ordering, planning, and later receiving. From the central dashboard select **New Expected Receipt**, or open **Expected Receipts** and select **New Expected Receipt**.

Figure: Expected Receipts page: review existing supplier deliveries or select New Expected Receipt. Enter the supplier name and expected date. The destination store is locked to the operating central store. Select an item and enter the expected quantity. Select **Save Receipt**.

Expected Receipts

Track incoming supplier shipments and confirm goods received

[+ New Expected Receipt](#)

Receipt No	Supplier	Item	Qty / UOM	Store	ETA	Status
05DD55F9	Demo Safety Supplier	Demo Safety Helmet	5 Piece	Demo Central Warehouse	2026-09-15	Awaiting GRN Confirm GRN
45C1EB41	Demo Building Supplies	Demo Cement 25kg	30 BAG	Demo Central Warehouse	2026-09-01	GRN Confirmed Complete

图 13 Figure: saved receipt: the row shows Awaiting GRN and offers Confirm GRN.

When the delivery arrives, select **Confirm GRN**. The physical-count screen shows the expected quantity, an Actual Counted field, and a Condition selector. Enter the quantity physically counted. Leave a normal good delivery as **Good**. Select **Confirm Receipt**.

Confirm Goods Received Note Awaiting Physical Count

Expected Receipt **Supplier**

05DD55F9 — Demo Safety Supplier Demo Safety Supplier

Physical Count Entry

Enter the actual quantity counted for each line. Leave blank to accept the expected quantity in full. Any variance will automatically create a discrepancy and freeze the difference.

Item	Expected Qty	Actual Counted	Condition	Variance
Demo Safety Helmet DEMO-HELMET-001	5	5	Good	—

✓ **System will automatically:**

- Create the GRN and update inventory
- Add received quantity to available stock
- Freeze any variance and create a discrepancy record
- Record the receiving manager and timestamp

✕ Cancel ✓ Confirm Receipt

图 14 Figure: Confirm Goods Received Note: enter the physical count and condition before confirming. The successful result is a completed GRN and updated available stock. If the count differs from the expected quantity, do not “make the numbers fit”; record the actual count so the system can create the correct discrepancy record.

7 Central Store Manager: approve a request and create the dispatch note

Open **Material Requests** and locate a row with status **Pending Approval**. Select **Approve**. The approval dialog shows the item, unit, requested quantity, and an Approve Qty field. Keep the quantity requested when the stock is available, or reduce it to the quantity that can be supplied. Select **Confirm Approval**. A successful approval changes the row to **Approved** and offers **Process Dispatch**. Select that action. The **Issues & Dispatch** screen shows the request and the approved item quantity. Enter the person collecting the materials in **Collector name**. Select **Create MIV & Dispatch**.

图 15 Figure: Issues & Dispatch page: enter the collector name and select Create MIV & Dispatch. The saved result changes the request to **In Transit**. The action becomes **MIV PDF**. Select **MIV PDF** when a printable dispatch note is required for the delivery file or the driver.

Figure: Material Requests page: an approved request is ready for Process Dispatch, and a dispatched request later shows its transit status.

Button or status	What it does	What success looks like
Approve	Opens quantity review.	An approval dialog appears.
Confirm Approval	Commits the approved quantity.	Row changes to Approved.
Process Dispatch	Opens the dispatch screen.	Collector name field appears.
Create MIV & Dispatch	Deducts central stock and creates the issue record.	Row changes to In Transit.
MIV PDF	Downloads or opens the dispatch note.	A printable MIV/dispatch note is available.

8 Site Store Manager: receive the delivery

Open **Material Requests** and find the row with status **In Transit**. Select **Receive Items**. The receive dialog shows the item, UOM, dispatched quantity, and Actual Received Qty. Count the physical delivery before typing.

Receive Items for Request #4B478FA8

Inspect and enter the actual physical quantities received at your site store. Any missing or extra quantity will automatically generate a discrepancy log.

Item	UOM	Dispatched	Actual Received Qty
Demo Cement 25kg	BAG	10	10

图 17 Figure: Receive Items dialog: compare the physical count with the dispatched quantity. Enter the actual quantity received. If the number is different from the dispatched quantity, keep the real number: the system will create a discrepancy log. Select **Confirm & Deposit to Inventory** only after the quantity has been checked.

The successful result changes the request to **Received** and shows a confirmation message stating that the request was marked as received into the site store. The item then appears in the site manager's Consumption page.

图 18 Figure: saved result: the request is Received and the confirmation says stock was deposited into the site store.

9 Site Store Manager: record consumption

When the site uses material, record it promptly. Open **Consumption**. The page lists items held at the site store with On-Hand, Available, and Consumed amounts. Select **Consume** on the item being used.

图 19 Figure: Consumption page: select Consume beside the item that was used. Enter Quantity Consumed. Confirm the Date, and add a short note such as the work area or reason. Select **Log Consumption**.

Consume Demo Cement 25kg

Log stock usage for Demo Site Store (DEMO-CEMENT-25KG).

Available Stock
10 BAG

Quantity Consumed

Enter quantity

Date

08/27/2026

Notes (Optional)

Reason / utilization details

Cancel Log Consumption

图 20 Figure: Consume form: quantity, date, and optional utilization note.

The saved result updates On-Hand and Available downward and increases Consumed. A success message identifies the quantity and item that were logged. In the verified example, logging 3 BAG changed On-Hand from 10 to 7 and displayed “Successfully logged consumption of 3 × Demo Cement 25kg.”

图 21 Figure: saved result: the table updates and a Success message confirms the consumption.

10 Site Store Manager: returns, counts, and discrepancies

The site manager's remaining operational pages support control rather than new catalogue setup. Use **Returns** when serviceable or damaged materials must be sent back. Use **Stock Counts** when the physical shelf count must be reconciled with the system. Use **Discrepancies** or the alert shown on the dashboard when expected, dispatched, or received quantities do not match.

The safe rule is to record what is physically true. Do not use consumption to hide a missing delivery, and do not use a return to correct a counting mistake. The system's workflow is designed to preserve the audit trail.

Situation	Open this page	Record this information
Material sent back	Returns	Item, quantity, condition, and reason.
Shelf count is needed	Stock Counts	Physical quantity and any variance.

Delivery does not match paperwork	Receive Items, then Discrepancies	Actual received quantity and explanation.
Central stock is short or frozen	Issues & Dispatch, Items, and Discrepancies	The approved, dispatched, and available quantities shown by the system.

Stock Returns to Central Store

0 awaiting confirmation

Return No	Project / Store	Items	Status	Action
No returns on record.				

图 22 Figure: Returns page: use it for a controlled return rather than changing the original request.

图 23 Figure: Stock Counts page: use it for periodic physical reconciliation.

11 Central Store Manager: reports and daily checks

Open **Reports** to review the system's reporting area. Use the dashboard first for urgent work: Pending Approvals, Pending GRNs, Open Discrepancies, Low Stock alerts, and Store Capacity. Then use the relevant operational page to complete the transaction rather than treating the alert as a final result.

图 24 Figure: Reports page: the central manager's reporting area.

A simple daily check is enough for most users. First look at the dashboard's alerts. Second clear work that is waiting for your role. Third compare the central Available and Reserved numbers before approving a request. Fourth confirm that dispatched rows become In Transit and that site managers receive them. Finally review discrepancies rather than leaving them unresolved.

12 When the screen does not look right

If a button is missing, first check the role displayed near the top of the page. A Site Store Manager should not expect central-only menus such as Expected Receipts or Stores. A Central Store Manager should not expect to log site consumption for a site store. If the operating store is wrong, sign out and sign back in with the correct account.

If a save appears not to work, look for a validation message near the form. Required fields, duplicate item codes, empty request lines, invalid quantities, and insufficient stock are the most common reasons to stop. Correct the form and try the same save again; do not create a second record until you have checked the list page.

If a workflow appears stuck, use the status as the answer. **Pending Approval** needs a central manager. **Approved** needs dispatch. **In Transit** needs the site's physical receipt. **Received** means the stock is available for site use. A discrepancy means the physical and system records need review.

13 One-page quick reference

If you need to...	Select...	Then...
Create a catalogue item	Items → Add Item	Fill the fields → Save Item → verify the new row.
Record a supplier order	Expected Receipts → New Expected Receipt	Enter supplier/date/item/quantity → Save Receipt.
Ask for site stock	New Material Request	Choose project/source/item/quantity → Add to Request List → Submit Request.
Approve a request	Material Requests → Approve	Review quantity → Confirm Approval.
Dispatch approved stock	Issues & Dispatch → Create MIV & Dispatch	Enter collector → create dispatch → use MIV PDF.
Receive a delivery	Material Requests → Receive Items	Enter actual count → Confirm & Deposit to Inventory.
Record stock use	Consumption → Consume	Enter quantity/date/note → Log Consumption.
Investigate a mismatch	Discrepancies	Compare expected, dispatched, received, and physical quantities.

14 Scope and training package

This document is intentionally an operator guide. It does not contain system-administrator instructions, internal account provisioning steps, database commands, deployment commands, Docker commands, secret values, or role-assignment procedures. Those activities are outside the intended audience for this guide.

The accompanying video package is organised into two folders. The `site_manager` folder demonstrates sign-in, creating and submitting a material request, receiving an in-transit request, and logging consumption. The `central_store_manager` folder demonstrates sign-in, adding an item, recording an expected receipt and GRN, approving a request, creating an MIV and dispatch, and producing a dispatch-note result. The videos were captured with the open-source Recordly desktop recorder against the running application. Recordly's Linux environment reported that native capture and animated cursor smoothing were unavailable; the recordings therefore show the normal screen and cursor without claiming animated cursor effects.

The workflow diagrams in this guide are generated from diagram-as-code source files included in the accompanying project archive. They are intended as quick visual reminders, not as a substitute for the click-by-click instructions above.

End of user-facing guide
